AB The first synthesis of a series of glutamic acid based dendrimers having a central ferrocene core is described. The materials were fully characterized spectroscopically and display strong intramol. H-bonding. This H-bonding can be disrupted with DMSO. The redox properties of the core are attenuated by the increase in the peptide dendritic sphere. But even at generation 6, there is communication between the exterior and the redox core.

AB Gelling organic compds. having ferrocene groups, i.e. N-(ferrocenecarbonyl)glutamine and -asparagine derivs. represented by the general formula (I) (wherein R1 and R2 are each independently alkyl having two or more carbon atoms or alkyl containing at least one ether linkage; X and Y are each hydrogen or a substituent; and n is an integer of 1 or 2) are prepared Also disclosed are gels and cast films made by using the compound I. These compds. I possess gelation property against organic solvent and ionic liquid Gels consisting of the compds. I possess excellent redox characteristic and are potentially useful as (1) gel actuator materials, in particular for medical goods or instruments for microsurgery, (2) artificial muscle for micromachines such as robot or motor, and (3) materials for electrolyte layer for photoelec. transducer, or redox layer for enzyme electrode (fixed bed for enzyme fixation electrode). Cast films of the compds. I on electrode substrate are used as interlayer materials between metal electrode and ion-sensitive membrane and as thin display devices. Ionogels obtained by gelling ionic liquid with the compds. I can be used as solid electrolyte for battery. Gels of the compds. I containing photosensitizers such as ruthenium trisbipyridine complexes are possibly used as light-driven gel actuator materials. Thus, 4.3 g 3-lauryloxypropylamine was condensed with 2.0 g Boc-Glu-OH using di-Et phosphoryl cyanide and Et₃N in THF for 30 min under ice-cooling then at room temperature for 3 days to give, after workup, 60.2% Boc-Glu(R)-R [R = NH(CH₂)₃O(CH₂)₁₁Me] which (3.4 g) was treated with CF₃CO₂H in CH₂Cl₂ at room temperature overnight and then with a mixture of acetone and 35 weight% HCl to give 40.9% H-Glu(R)-R [R = NH(CH₂)₃O(CH₂)₁₁Me].HCl (II). II (1.0 g) was treated with Et₃N in CHCl₃/H₂O and then condensed with 0.40 g ferrocenecarboxylic acid using 0.44 g Bop-Cl and 0.20 g Et₃N in CH₂Cl₂ for 30 min under ice-cooling and at room temperature for 3 days to give I [X = Y = H, n = 2, R1 = R2 = Me(CH₂)₁₀(CH₂)₃] (III). A 0.5 mM methanol solution of III was casted on an ITO substrate, air-dried to form a cast film which was used as an anode against a platinum cathode and a Ag/AgCl reference electrode to exhibit good redox characteristic by cyclovoltammetry.
